We run our own enterprise software for our customers through the TechnologyOne Cloud, taking complete responsibility to provide a simple, cost effective and elastic model of computing. We pass on the benefits of our economies of scale to provide a continually evolving cloud solution. Simply sign in to get enterprise software as a service.

The future of enterprise software, today

The TechnologyOne Cloud delivers the Ci Enterprise Suite through the cloud to our customers, in a high performing, reliable and secure manner.

This follows the software as a service paradigm of Google, Facebook and Salesforce, where users of these applications do not need to consider hardware, infrastructure or IT technical support. These software models are built and run solely by the software developer, who continues to invest in the platform to improve it for all customers.

By developing our software on the cloud, we pass on our economies of scale to our customers. When we make enhancements, improvements or add a new feature to our TechnologyOne enterprise suite, hundreds of customers benefit from that investment. This leads to exponential benefits for all our customers, which is not achievable with hand-crafted, individual hosted or on-premise solutions.

TechnologyOne Cloud offers all the benefits associated with cloud computing and our customers retain full control and visibility.

Key benefits

- Simplicity - forget the complexity of owning and running your own data centre, databases, applications and technical staff. Focus on running your business.
- Reduced total cost of ownership - reduced IT costs, no leasing costs, no depreciation costs, no disaster recovery costs.
- Faster deployment - the TechnologyOne Cloud is already running, saving you significant effort in designing, procuring, installing, integrating and testing your own infrastructure.
- Future proof - new ideas, concepts and technologies are built in as part of the service.
- Gold Standard – we run and continually optimise our software for tens of thousands of users each day.

Today, businesses expect simplicity – software that is simple to use, yet highly sophisticated. Cloud computing enables this by allowing businesses to use enterprise software as a service without having to worry about the technology.

Cloud computing and the TechnologyOne Cloud is the platform of the future. This is the future of enterprise software, today.
